

A Legendary Analyst Predicted the 2017 Financial Crisis 60 Years Ago

Retrieved Wednesday 2nd of August 2017 06:47:48 PM
< class="l">

POITOU, FRANCE – Guess what U.S. stocks did yesterday...

They went up, of course. Just like they always do.

Some people have expressed wonder... and doubt... that the equity value of America's businesses can increase so much while national leadership is in so much disarray.

Republicans can't work with Democrats. Democrats can't work with the president. And Republicans can't work with the president, either... or each other.

Together... they can't work at all.

[Shah Gilani's Carbon Trade Recommendations are CRUSHING Everyone – with 44% Gains PER DAY](#)

The inventor of the carbon trade is now producing an average of 44% GAINS PER DAY (including partial closeouts)... to make you \$53,000 richer every month. If you're not making 44% per day... 88% in two days... and 132% in three days... average... you could be cheating yourself out of tens of thousands of dollars right now. [Details here.](#)

Primary Trend

At the start of the year, analysts explained stock market gains as a "reflation trade."

The idea was that lower taxes and more infrastructure spending under the new Trump administration would set off an economic boom with higher growth rates, higher sales, higher inflation... and, of course, higher stock prices.

None of those things happened – except the higher stock prices.

Go figure.

We wish our old friend Richard Russell were still alive to help us figure it out.

Richard studied the stock market, day by day, for over half a century in his newsletter, *Dow Theory Letters*. He started his career in New York and ended it in La Jolla, California, keeping his eye on the stock market all the time.

Until the end of his life, his instincts were sharp.

It was Richard who introduced us to the idea of big, long movements in stock prices – what he called the stock market's "primary trend."

Yes, the market goes up and it goes down... apparently at random. But over the long run, it also follows patterns – movements you can only see from a distance.

The idea is to buy near the bottom and sell near the top. Everything else is detail.

[“Da Vinci Device” creates 6,600% gains](#)

Experts are calling it the “Da Vinci Device”... and it’s generating 10-bagger gains in 2017. One reader, Ted T., turned a stake into \$691,000 in 2017. Now he’s about to retire. Another, Jon M., turned \$300 into \$43,000 virtually overnight... s have never heard of such gains in such a short time frame!” I’ve heard dozens of stories like this from my readers. It’s a to the “Da Vinci Device.” And it’s creating more new millionaires than anything since the internet. [Click here for the full](#)

Ringing the Bell

After World War I, gold – real money – flowed into the U.S. France and Britain had borrowed heavily and were now repaying.

This increase in the money supply – along with the invention of automobiles, electric appliances, and consumer credit – led to a boom.

Stocks soared and everyone wanted to get in on it. By the late 1920s, waiters were getting rich. And shoeshine boys were giving stock tips (which is supposedly what convinced JFK’s father, Joseph Kennedy, to sell out).

“The stock market will always find your weakness and exploit it,” Richard would say.

Greed is a weakness. Envy is another. A 6% return is fine... until your brother-in-law makes 10%.

When stocks go down, every wants out. When they go up, every wants in. And when everyone has bought into the myth of ever-rising stock prices, it’s time to sell.

“They don’t ring a bell at the top,” say the old-timers.

But the old-timers, like Richard, heard bells ringing anyway.

As it happened, stocks collapsed in 1929... the margin calls went out... investors lost fortunes... banks failed... the Hoover-Roosevelt administrations intervened... and the Great Depression took hold.

Stocks hit bottom in 1933. Then they recovered. But they didn’t return to their 1929 values until 1956 – 27 years later.

From there, the U.S. stock market kept going up for another 10 years. This brought the primary bull market trend to 33 years. By then, the old fellow was losing his vim and vigor.

That was the era of the Nifty Fifty – 50 large “growth” stocks that investors believed would dominate the world and make all rich by simply buying and holding.

Naturally, those 50 stocks – including the now-defunct photographic film and camera makers Eastman Kodak and Polaroid – crashed the market higher.

[Man Who Invented 401\(k\) Savings Plan Warns About 3 Big Dangers](#)

If you've got an IRA or a 401(k), watch out... Ted Benna, the man who created the first 401(k) savings plan back in 1981, recently spoke out about 3 big dangers he sees coming and where he now has his money. [Click here to continue...](#)

Bear's Lair

But another of Richard's dicta was "the bear always wants to take as many people down as possible."

We invent reasons to do dumb things. Instead of doing careful stock market research, mom-and-pop investors simply run into the Nifty Fifty... directly into the bear's lair.

By August of 1966, the top was in, with these "one decision" stocks at their peak.

Richard, who was already on the job, heard the bells ringing. And for the next 16 years (though the numbers are distorted by high inflation rates during this period), stock prices fell.

By the early 1970s, stocks were reaching another major low. At one point, you could have bought the Dow Industrials for one ounce of gold.

In 1979, *Businessweek* magazine published its famous "Death of Equities" cover story. But equities weren't dead at all. They were just reviving after a long primary trend lower.

What followed is recent history. Starting in 1982, stocks began a new bullish primary trend... and rose for almost two decades. In the summer of 1999, thanks to the wonders of the internet, investors thought they had entered a "new era" of ever-rising stock prices.

It was not to be. The dot-coms crashed. But investors were right in another sense. It was a new era of financial hocus-pocus, with the feds intervening to support stock prices as they never had before.

After former Fed chief Alan Greenspan rushed to pump up stocks in 1987, the fix was in.

Since then, stocks have tried to correct twice. The Nasdaq collapsed in 2000; the entire U.S. stock market took a plunging fall in 2008.

Each time, the Fed came to the rescue. In 2009, it mounted its largest bailout ever. It stuffed the financial sector with \$3 trillion of fake money via three separate quantitative easing (QE) programs.

And now – taking 1982 as the beginning point – this bull run has been romping for 35 years.

What would Richard say about it?

"I don't know..." says a voice from the grave.

"It could be my cell phone. Or it could be my tinnitus acting up. But I hear something ringing..."

Regards,
